

Hex to Instruction Conversion

Table mapping hex values (0-15) to instructions for registers 0-F and flags 0-F. Includes instructions like ADD, MOV, PUSH, POP, etc.

Table mapping hex values (0-15) to instructions for registers 0-F and flags 0-F. Includes instructions like JNC, JNE, JNG, etc.

Miscellaneous Notes

COMPATIBILITY: The 8086 and 8088 are 100% compatible in machine and assembly languages. SEGMENTS: Memory segments are 64K byte sections of the full megabyte space...

SECOND BYTE TABLE (see below). Following the listed opcode byte(s) go an immediate displacement or address if applicable and finally immediate data if applicable.

'C' COLUMN OF INSTRUCTION SET: These codes refer to the CYCLE CODES TABLE.

CYCLE CODES TABLE: Listed numbers are instruction execution times in CPU cycles. When 8086 and 8088 times differ, the 8086 time is given first and the 8088 is given on the next line.

SECOND BYTE TABLE: This table allows conversion to and from hex of the second byte (excluding prefixes) of an instruction. The table is referred to by other parts of this card in such forms as X2, X3, X4, MX, KX, etc.

HEX TO INSTRUCTION TABLE: To convert from hex to an instruction, scan down for the first digit (MSD) and across for the second. Two-character codes (upper case) in the table refer to sections of the SECOND BYTE TABLE only when they appear on the first of the two lines of an entry.

r = byte register; rr = word register; i = immediate byte value; ii = immediate word value; d = immediate signed byte displacement; dd = immediate signed word displacement; aa = immediate two byte address (offset from segment start) (address can be of byte or word); aaaa = immediate four byte address (2 byte offset followed by 2 byte segment address/16); m = memory byte specified by memory pointers of section X of SECOND BYTE TABLE; mm = memory word specified by memory pointers of section X of SECOND BYTE TABLE.

x = reg or mem byte; xx = reg or mem word; sr = segment register; dw = memory double-word specified by memory pointers of section X of SECOND BYTE TABLE.

ws = within segment; as = another segment; () = data in mem.

Where 'byte' or 'word' is listed, the assembler may require a dummy register to labels.

Instruction Description

Flag Codes

- A = A C O U P U S Z U; B = A U C U O U P S Z; C = A C O P S Z; D = A U C O P S Z; E = EVERY FLAG; F = NO OTHERS; G = A O P S Z; H = C O; I = I T; J = A C P S Z; K = A U C U O U P U S Z U; L = A U C O P U S Z U; M = A C O U P S Z; N = NONE

Flags

- A = Aux carry flag; C = Carry flag; D = Direction flag; I = Interrupt enable; O = Overflow flag; P = Parity flag; S = Sign flag; T = Trap flag; Z = Zero flag

Registers

Table mapping hex values to registers: AH, AL, BX, CH, CL, CX, DH, DL, SP, BP, SI, DI, IP, CS, DS, SS, ES, DS, DS, SS, ES.

Table mapping hex values to instructions and their descriptions. Includes instructions like AAD, AAM, AAS, ADC, ADD, AND, CALL, CBW, etc.

8086 & 8088

MICROPROCESSOR INSTANT REFERENCE CARD

Instruction Set table with columns for instruction name, addressing mode, and operation. Includes instructions like ADD, AND, CALL, etc.

Cycle Codes table showing cycle counts for various instructions and addressing modes.

Second Byte Table showing bit patterns for various instructions and addressing modes.

Example section showing a sequence of instructions and their corresponding cycle codes and second byte values.

Hex and Decimal Conversion table for converting between hexadecimal and decimal values.

Memory Locations table listing various memory addresses and their functions.

ASCII table showing the mapping between ASCII characters and their binary/hex values.

Pinouts section containing detailed pin configurations for the 8086 and 8088 microprocessors.

Pinouts section containing detailed pin configurations for the 8086 and 8088 microprocessors.
